Hi,
I have had the same problem, but when I used the "without header" option in WIDED
saving the *.pro worked (except it had no header). To make the normal "save pro"
work I had to move/copy the file "template.pro", which WIDED uses as the header,
to the "help::widget" folder (which is the place WDIED expect template.pro to
be). By the way, I found "template.pro" in the folder "examples::general" but
do a search to be certain.

Nowadays WIDED works just fine.
Hope that this helps.

Cheers
 Mikael
