Thank you for the help. Your suggestions are good, but I think you did not understand what I wanted exactly. I want to use the label\_region in order the imnew to contain three segments. The first segment contains pixels from the first channel, the second segment contain pixels from the second channel, and the third segment contains pixels from the third channel. Having used the label\_region I can tv the imnew by giving one pseudo color to each segment (I do not know how to do that as will).

And using the label\_region will let me further process each segment separately after that.

I hope it is clear now. I am beginner in IDL and I do not know many things. so your help is appreciated.

Thank you very much

MD
