
Subject: How to use Envi GLT when there are NaNs in the lat/lon files?

Hi, I'm trying to georeference an image covering a very large area - pixels in the ocean were given as NaN. This image was projected, but I was not able to set up its projection in Envi based on the available parameters. However, there are lat/lon files for all of the grid points in the image. So I thought I could use GLT to register the image myself. Then there are NaNs in the lat/lon files same as in the image file. Does anybody have experience of applying GLT from lat/lon with missing values? Is this possible?

Thanks for any advice,

Jenny
