
Subject: strange behaviour of .skip command

Hello everyone,

In the fine tradition of *trying* to get things done quick, I have a code segment that looks like :

```
if {some condition} then begin
.
.
{some random text to make the code break}

endif else begin
.
.
endelse
```

The code breaks at the random text, I check for the variables and conditions that were set in the "if part", and if all is well, I issue a .skip and a .continue. Now, it turns out that under such conditions (if the random text is located right before the endif statement), the code execution actually proceeds through the else-endelse segment as well. However, if there is any other statement between the random text and the endif statement, then the code execution does not go into the else-endelse segment.

Granted this is quite an unique situation to find oneself in, but having spent the better part of a day trying to track this down, I thought I would check with the group and see if this was a reproducible behaviour.

Is my understanding of .skip incorrect ? Does it skip through more than 1 line even when invoked without an additional parameter ?

In any case, it boggles my mind seeing code go through both the "if" and "else" part in one execution !

Cheers,
Manodeep
