Well, the documentation says

"The WSHOW procedure exposes or hides the designated window."

and in the case of my window 12 example, it indeed "vanishes". Anyway, here's the context:

```
PRO VIEWSEG_RUN, event
widget_control, event.top, get_uvalue=dn
envi_disp_query, dn, fid=fid, w1=w1, color=color
wshow, w1[1], 0; nothing happens
...
...
```

I call this from the ENVI display menu, so dn is is the number corresponding to the display group, consisting of the image window (with the display menu at the top), the zoom window (which I want to hide) and the scroll window.

The reason I want to do this, is that I want to copy the content of the image window to a pixmap _without_ the little red square that marks the current position of the scroll window. Maybe that won't work anyway. It's getting late in Old Germany ...

Cheers

Mort
