Hello,

I get this dangerous bug rather randomly running IDL 4.0a on a PowerMac 7500. Any one with similar problems? IDL fails to return the correct answer in statement 4.

```
IDL> help,yy
YY          FLOAT    =    35.0000
IDL> help,last_row
LAST_ROW    FLOAT    =    89.0000
IDL> print,last_row-yy
    54.0000
IDL> print,fix(last_row-yy)
    53
IDL> print,fix(last_row)-fix(yy)
    54
```

Would appreciate any insight.
