Hi,
I am writing a Data Reduction GUI software in IDL. I wanted to be able
to call another useful package thats already there (ATV.pro) from the
GUI for quick analysis. So I did that. But a problem I ran into is ATV
modifies the color table. This messes up all my colors in the GUI that
I wrote. I tried using tvlct, rr,gg,bb,\get and loading it back. This
didnt work either. In my GUI I dont load colortables or do anything to
them. Instead I just use the color keyword for each colors. If anyone
could help me out I would be internally grateful:). Thanks
