Subject: IDL bus errors

IDL 4.0.1, Solaris 2.4, Sparc 20.

We use a 15,000+ line IDL program to manipulate data. It's not
uncommon for this program to crash several times during the day with a
bus error, which is pretty annoying, because apart from the crash it's
just about impossible to track the source of the error without putting
in lots of print statements throughout the code to track location. Do
other people get this problem, and if so, do you think it's an IDL
problem or our programming? How can we identify the location and fix
it?
