Folks,

A friend of mine and I have been reading each others IDL code lately. It's truly amazing what you can learn by doing this!

Anyway, I have this line of code in one of my programs:

```
HELP, CALLS=callstack
```

He was flabbergasted. Apparently, this keyword is not documented. I'm dumbfounded, too, since I don't usually use undocumented code.

Here is my question. Was this ever documented? Does anyone else know about this?

Cheers,

David

P.S. You can tell this is an old IDL keyword, because CALLS obviously stands for "CALLSTACK", and yet you can't use "CALLSTACK". This is one of my favorite pet peeves about IDL, but I think the programmer who used to do this all the time has now moved on.
