Thank you very much for your suggestions. I changed all my filenames to lower case and I deleted all additional !Path entries. Now !Path contains the standard IDL paths and additionally only the path pointing to the project directory. Nevertheless it doesn't work. But I think it's still a "path" problem because I realized following behaviour. If I run the project and start a specific routine (which wasn't included in the sav file at first), it appears that this specific routine is correctly included, when the sav file is created afterwards.

Many thanks so far,
Helmut Ahammer
