Subject: Re: fast convolving question
Posted by rogass on Thu, 29 May 2008 11:38:08 GMT

Because of the time which the in-built routine consumes while convolving large arrays with large arrays.

But, did you see the error, why:

else (conv)[(i=indarray2[0:sm-1])]=kernel##mat(indsmall+ind(i))

only works for the first ind(i=0) and then repeats it by using always ind(0) instead of ind(i)?

It this a bug or error in code?

Tanks and best regards

Christian
