Hello,

When I try to launch a .sav file with the runtime version of IDL 6.3, the Runtime App window appears in the taskbar then disappear suddenly. No warning, no error message. The program doesn't work. When run with the Virtual Machine there isn't any problems, although the EXECUTE do not work, as expected.

The demo file from RSI do not work either. It seems idlrt.exe crashes each time it is used in runtime mode.

I have IDL 6.0 and 6.3 installed, but on other computers that have the 2 versions installed there is no problem. Any clues ? (Running on Window XP Pro 2002 SP2)
