
Subject: IDLWave opens new frame on error/stop

And another question: I have the idlwave shell running in a dedicated frame. However, when I hit an error or a stop, emacs will split the dedicated frame (showing me the error in both the split frame and in the original source), AND opens a new frame with a mirror of the command line.

I can only assume this happens because I have some redundancy between the dedicated frame and something else, but closing two windows every time I need to debug is a serious draw on my morale. Any suggestions as to what I've done wrong here?

My working .emacs file can be seen here:
<http://www.higp.hawaii.edu/~koeppen/my.emacs>

It's shamelessly ripped off from other more seasoned users, hence my issues.
