
Subject: Workbench problem following update

Greetings,

I just allowed the IDL workbench to install an eclipse update to itself (sorry, I didn't pay too much attention to what it was installing other than it was a eclipse patch it downloaded overnight).

However, when I restarted IDL I get an empty workbench!

Poking around I find the window-perspective in the menus and open the IDL perspective which results in an error creating some view and most of the views reappear. Another problem is that I now get errors opening the IDL editor.

Is there any easy way (without losing everything I'd already setup) to 'reset' the workbench?
