
Subject: Problem with brainless Windows IDL7

Hi,

I just installed IDL 7.0 on another Windows PC. Install went fine, but when I enter any commands at the prompt and hit enter, the commands just disappear. They do not show up in the console log and variables set do not show up in the variable view. "?" does not open help either. It seems that there is no connectivity between the DE and the opserver process. I tried restarting a few times making sure that no orphaned idlde.exe or idl_opserver.exe were still running. The problem remained. I also reinstalled twice and the problem is reproducible. I have IDL 7 installed on several systems in the past and never seen this problem. Does anyone have any idea about how to approach this problem?

Any help is appreciated.

Cheers,

Haje
