Hi all!

I've installed IDL 7.0 on Ubuntu 8.04. Everything seemed to work fine but lately when I start the command 'idl', here's what I got...

```
[usr@localhost] idl
```

```
IDL Version 7.0 (linux x86 m32). (c) 2007, ITT Visual Information  
Solutions
```

... and remain that way. The same occurs when trying to start DE. It simply doesn't start the IDL environment but don't give any error message as well. It seems to keep trying to do something I don't know.

Does anybody has faced such problem to start IDL?

Cheers!
