Ok, so I'm trying IDL7.0. Thanks to this newsgroup I was prepared and followed a course on Zen meditation before taking on the big 7.

Everything was going well until I tried to change the current directory (with `cd,'c:\...'`), hoping it would stay like that we I execute a widget app. I stripped the widget app (see below). If you would compile this and run it, everything goes well, i.e. pressing the button will print the path I set. However, if you try to make a project out of it (with 1 file) and you would "build + run the project", the path printed will not be the one I set.

Any ideas?

Wox

```
pro test_event,ev
cd,c=c
print,'Directory after xmanager: '+c
end
```

```
pro test
dir='c:\temp\'
base=WIDGET_BASE(MBAR=bar,/row,title='TEST:',scr_xsize=300,scr_ysize=100)
button= widget_button(base,value='check '+dir+' ...')
cd,dir,c=c
print,'Initial directory: '+c
cd,c=c
print,'Set directory: '+c
WIDGET_CONTROL, base, /REALIZE
Xmanager,'test',base,/NO_BLOCK
end
```
