Hi Cindy,

You can "steal" bitmaps from other standard programs by doing a screen capture while you have them loaded, and then pasting the captured graphics into a graphics editor such as Adobe photoshop. You need to be careful about the size and bit depth of the picture that you save, and I think the transparency color is set by the colour of the bottom left pixel in the image, but those are details you can figure out with a bit of digging. I've added lots of bitmap buttons to my programs this way.
