Hi all

I have a little strange problem, may be somebody see mistake here?

It's a part of my programm. I don't know why, but the name of output evf looks like as sqfiles[jj]

I can't add w to the end of evf name. It's very strange because this procedure I made earlier and it always worked.

```
envi_file_query, rs_fid, dims=dims, ns=ns, nl=nl, $
  class_names=class_names
pos = [0]
values = [1]
l_name = class_names[values]
out_names = sqfiles[jj]+'w.evf'
in_memory = lonarr(n_elements(values))
;
; Call the raster to vector processing routine.
;
envi_toggle_catch
  envi_doit, 'rtv_doit', $
    fid=rs_fid, pos=pos, dims=dims, values=values, l_name=l_name, $
    in_memory=in_memory, out_names=out_names
```

I will very thankful for help.
