Save the entire chunk of code as 'grapharray.pro', compile it and call it as an IDL function:

Output = Grapharray(Xvalues, Yvalues)

When the program returns (after you right-click in the window), your array will be stored in the Output variable.

Also, this line:

Diff = XDiff + YDiff

Should probably read:

Diff = SQRT(XDiff^2 + YDiff^2)

Good luck,
Chris
