
Subject: What Else!? More IDL 7 Woes.

Folks,

I've recently upgraded to IDL 7.0.3. I haven't tried this before, but I wanted to make a save file of my Catalyst Library. After some mucking around, I figured out how to build the project save file. When I click on it, all appears to be well. I have all the normal functionality, etc. (I am running this in a normal IDL session, not on the Virtual Machine or as a run-time yet.) No other routines are compiled, etc. Everything appears normal and as I expect.

But when I exit this application, IDL crashes. If I run the same program, but from the *.pro file, there are no problems whatsoever on exiting the program.

I really don't have a clue. Has anyone else experienced this problem?

Cheers,

David
