
Subject: problem with techtip 3798 (IDL + cygwin)

Hello:

I followed the directions in techtip 3798 ("Using CALL_EXTERNAL with the Cygwin environment"). I needed to make one change in the directions; I changed the reference in the tech tip directions from IDL61 to IDL62se to reflect the fact that I have a student edition of IDL (in the redefinition of !make_dll.cc).

On attempting to run the examples of C inclusions into IDL, I get the following output. I get similar issues when trying to compile other C code as well (ie, Could Not Find errors for .lib, .exp, and .obj files). I believe that this might be a configuration issue....somewhere..., but I am not sure where and google has not proven to be my friend with finding references to the same issue elsewhere. Has anyone else encountered this problem before and know of a solution? (And are .lib, .exp, and .obj files an IDLism? From the default C compiler in windows IDL? From the phase of the moon?)

I have access to the full version of IDL as well, if someone thinks that is the problem; however, the IDL student edition is the only version in which I installed all the necessary files.

Thanks for any insights!
