Hi, Folks

I wrote a small utility program to help embedded formatting. You just need to mouse click to select font type/name, the special characters you want and the position controls you would like to use. The resulting output can also be previewed immediately. You need to have ImageMagick installed in your system to preview the postscript fonts. I have tested it on WinXP and 32bit Linux. Please let me if it works for you and what you think of it. Thanks!
