You realise, of course, that a rudimentary search of this newsgroup's archives of your recent posts will reveal that not to be the case. You'd better start reporting more of your Workbench success stories to up the SNR. :o)

<my quick retort morphed into a mini-rant. Sorry.>

I've finally gotten used to the iSurface tool and the horrendously arcane visualisation browser[+]. The easy rotation of surfaces I find *\*very\** useful. Unfortunately it is impossible to obtain a good quality PS of any iTool figures. And, if it is, ITTVIS has quite effectively buried the functionality to do it well beyond any eShovel I have. Grrr....

I use iTools to visualise stuff - but to get publication plots I have to replicate everything in direct graphics where I actually have control over PS output. Yesterday I spent 30minutes replicating the intersecting surface plots in direct graphics so I could create a PS file for import to a document. What took about 30 seconds in iTools took 30 minutes in DG (which is not too bad, really). Next time I have to do that, I'm going to spend the 30 minutes combing the building for someone with a Matlab license (which I now know exist since some Mathworks guys dropped by and gave a quite amazing presentation a couple of weeks back).

cheers,

paulv

[+] That there is no way to adjust axis ranges by clicking on them (you have to select "Data Space" in the vis browser) just makes me shake my head and sigh. The computing science division of ITTVIS must work on separate floors from the cognitive psychology

division. (ha ha)
