IDLers,

Before I set out and reinvent the wheel I decided to check and see if any of you have done something similar.

I want a more robust ROI definition tool than what come w/ IDL. The cw_defroi is a good start, but I want to be able to define the ROI and then use the mouse to drag the ROI and reposition. Something like what can be done with annotate.

If anyone has done this and wouldn't mind sharing code I'd greatly appreciate it.

Thanks in advacne,
