Hi!

I have an array which contains values of longitude, latitude and some function value. I want to plot these points on the sphere using spherical gridding (sph\_scat). There are 68 points in the array and bounds are  
longitude : 112 - 180  
latitude : -30 - 40

When SPH\_SCAT calls TRIGRID, strange error message is displayed by TRIGRID :

% TRIGRID: Array XYZ does not have enough elements.

I checked the size of variables on the input to TRIGRID - everything is Ok. Any ideas why this can happen?

Any response/clue will be highly appreciated!

Thanks

Anton
