
Subject: merge data-array with calender-date-array

the newbie calls out for help again :)

Problem:

I have two arrays: one with my MODIS-data (float), the second with the "matching" calender dates of the data (string, like "01/Jan/2002"). Say the first number of the "data-array" belongs to the first date of the "date-array".

What's the easiest way to merge those two arrays so that I will be able to easily plot the data with the matching dates as x-axis.

Goal/Purpose:

Plotting a time series of the data with the matching date on the x-axis.

probably a super-easy task, but I only come up with rather inelegant solutions and I'm sure there's a simple and elegant way to do this.

Cheers,
juls
