Subject: merge data-array with calender-date-array
Posted by julia.walterspiel on Thu, 24 Jul 2008 09:29:47 GMT

the newbie calls out for help again :)

Problem:
I have two arrays: one with my MODIS-data (float), the second with the
"matching" calender dates of the data (string, like "01/Jan/2002").
Say the first number of the "data-array" belongs to the first date of
the "date-array".
What's the easiest way to merge those two arrays so that I will be
able to easily plot the data with the matching dates as x-axis.

Goal/Purpose:
Plotting a time series of the data with the matching date on the x-
axis.

probably a super-easy task, but I only come up with rather inelegant
solutions and I'm sure there's a simple and elegant way to do this.
Cheers,
juls
