Subject: idlworkspace trouble

Hi

if I try to access the same workspace dir from a different machine (only from one at a time) that dir seems to become corrupted and I can use idlde only if I have removed that dir completly.

On some of our systems it looks like not every idl installation is able to create a full working workspace dir. But on those machines I can use a workspace dir which was created on a machine whithout this problem.

That is rather strange trouble and I have no idea yet where or what is broken.

Any idea ?

cheers
Reimar
