
Subject: Providing files for VM-Application

Hi there,

I'm currently coding a project for a colleague. Unfortunately I have to build the application for the VM because the colleague does not have an IDL-license.

The project needs some kind of dummy-files to read some information from. Using the `idlde` I have the opportunity to provide these files, I think. I just put the file in the "data-folder" of the project. Later on I want to open the file with `openr`.

While testing the application on a VM I always run into a "file-not-found" error. I have no idea in which way I have to specify the path to the file in the source-code.

I tried:

```
hname = '\data\header.ima'  
hname = '\header.ima'
```

and then

```
openr,unit,hname,/get_lun
```

Always running into the "file-not-found" error. So where can I find my provided files after having built the project? Any idea would be appreciated.

Regards,
Andreas
