
Subject: Using cursor command on the multiple plots in the same page

Purpose: Detect the cursor position in multiple plots on one window.

At first, I use `!p.multi=[0,2,2]` to set the four plot regions.

I plot something in each region.

Then I use `"cursor, x, y, /down"` to know the cursor position.

No matter on which plot I pressed the cursor down,
the values of x, y are always referred to the last plot.

Is there anyway that x, y are referred to their own plot, not the last one?

Thanks

Yafeng
