Thanks for the response, I have another question though.

For the

```
IDL> help,table,/structure
```

```
** Structure <1229360>, 3 tags, length=300, data length=300, refs=1:
```

```
FIELD1      INT      Array[*]
```

```
FIELD2      FLOAT    Array[*]
```

```
FIELD3      FLOAT    Array[*]
```

```
IDL> a6=fltarr(3,*)
```

How might I set it up so that the \* in the array automatically becomes placed in the fltarr? i.e. if: array[30] then automatically place 30 into fltarr such that fltarr(3,30).

The table structure is throwing me off.

Thanks,  
Matt
