Hi,

I was having a problem while I tried to launch IDL Workbench or Help window. My problem was with libxul and while I am at loading screen I was getting hotspot java virtual machine error.

I am a beginner in in Linux (I use RHEL 5.2) and also new in IDL. It took me a couple of hours to resolve these issues. Finally I get rid of the bug by uninstalling xulrunner and I had to install Firefox 3.0 (it was a dependent file to xulrunner) It works fine but I downgraded my Firefox to v1.5.something. I think either producer of Xulrunner or IDL should release a patch about this problem.

I think for your case, best case would to ask a direct help from the IDL people.
