Well, yes, but don't go crazy on me. If you check my record, I think you will see there is a better than average chance I am right about these kinds of things. I'm used to seeing bad IDL code. :-)

Right, it shouldn't.

I'm thinking right at the moment that this is a red-herring. Maybe if you get the other things sorted out, this will sort itself out, too. If not, then tell me if this is *exactly* the same data that ran on your colleagues machine, or just data that you are trying to run. If the latter, have you tried making it double precision data?

Well, goodness. Maybe you could write a short note to my wife. She thinks I goof off all day long. :-)

Cheers.

David
