Well, I guess you have thought of the obvious:

```
function mystrct
tmp = {mystrct, $
    foo:0.0d, $
    bar:2.365434d
    }
return, tmp
end
```

```
IDL> thisStruct = Mystruct()
```

If you want it to be created the way YOU want it created,
why let IDL fool around with it?

Cheers,

David
