it might be shorter / faster to create a dummy batch file, in its own file, that calls the real batch file. In your code, you always call the same batch file, and the only thing you have to do is to write the batch file name (the one defining your variables) in that pro file. 1 write statement and your are good!

something like:

openW, lun, 'myDummyBatchFile.pro', /get_lun
printF,lun, '@' + myGoodBatchFile_fileName
close,lun

then in your code
@myDummyBatchFile
