Today I found solution to this problem accidentally. I have one instant messaging application named "pidgin" on my computer. Today I changed the proxy settings for this application from manual configuration to direct internet connection. Subsequently, when I ran IDLDE, it started showing help in browser properly. To confirm that this was really due to change in PIDGIN's network settings, I changed back the proxy setting of PIDGIN from "direct internet connection" to "manual". This again stopped IDLDE from showing help and started showing "connection refused" error message.

It would be worth mentioning that all the while my browser (Firefox 3.) used option "System proxy" and never had problem in displaying webpage. My system proxy are set to relevant proxy setting for my department. It appears to me as though some configuration file is common between PIDGIN and IDLDE but don't know which one.

Hope this is helpful to someone.
