Which version of IDL?

There is a known seg. fault problem with IDL6.* and linux.

Assuming, this is the problem, you should be able to do a simple plot to screen like

```
x = findgen(100) / 10.  
plot, x, sin(x)
```

But if you get *tricky* and try

```
xloadct
```

The sky falls down.

Is this the situation?
