The problem is that the line

```
N = 182
```

sets N to a 16-bit signed integer (max size 32767-ish). When you square it (33124), it overflows and becomes negative (-32412). Use something like

```
N=182L (long integer with max size about 2 billion) or
```

```
N=2. (floating point)
```

As long as you have the RAM, arrays can have millions or billions (i think) of elements, so you'll be fine.
