Well, here is the solution for my problem.
Look at the declaration of the SUBROUTINE TRMESH in
http://www.netlib.org/toms/623 or http://www.netlib.org/toms/624.
There you find the definition for IADJ and IEND.
But: The indices contained in IADJ and IEND are not zero-based! Even in
the struct used in IDL. That's a little bit confusing. So you have to
correct for that, when you use these fields for a different purpose
than for TRIGRID.
Greets

Karlo
