
Subject: Casting boost::multi_array

There is a library in C++ called boost::multi_array. This library seems to be analogous to multidimensional IDL variables. I've written some methods for casting boost::multi_array types to and from IDL_Variables.

I'm in the business of pruning projects at the moment so I can concentrate on documenting some core ones (like GDLffDICOM). I've found IDL_Cast_Eg useful for my own projects, but I'm not sure it has much wider use.

Has anyone done something similar or require this kind of functionality?

The project can be downloaded by clicking on IDL_Cast_Eg at

<http://barnett.id.au/idl/>

Thanks

Robbie
