Hi guys/gals,

Please can someone help me, I am at my wits' end. I am attempting to use call_external function to call a 'C' program (eg example.c) , which itself calls F77 subroutines (eg example1.f). The example routines I am quoting are contained in the IDL User/Ref manuals, but being able to run these would give me great insight into running the routines I desire. The basic problem seems to be using the 'ld' command to create the necessary shareable library, and is not a compilation problem , I think !!!!!

Any help that you can provide would be most appreciated.

Thanks,
Scott

ps System is SunOS5 Solaris 2.5
