Regarding loops, I am kinda in the same boat. My advisor keeps complaining about how slow our code runs...We don't seem to know any better around here :-)

Q1) I have a generic array `foo(x,y)`. I'd like to divide each column by its max. Can this be done without looping ?

Q2) I have a generic array `foo=fltarr(a,b)`. I'd like to copy `findgen(b)` into every column. Any way of doing this without loops ?

Any pointers greatly appreciated.

Regards,
Santanu
