
Subject: workbench print variable problem

Hi all,

I just got my hands on the IDL workbench and I have a question. In older IDL versions it was possible to stop the code at a specified point and print the values of an array subscript (e.g., `arr [*,0:3]`) simply by highlighting the desired portion of the code and pressing the "print variable" macro button. In the workbench I am able to visualize the "full content" of an array by placing the cursor on the variable name and pressing F2, but I can't find a way to print the contents of a selected portion of an array without using the command line. Do you know if it is possible to "mimic" the behaviour of the "print variable" button in the workbench in any way ?

Thanks in advance,

Lorenzo
