
Subject: making a composite from several images

Hi all,

Could someone outline a simple way to create a composite image from several images. I have about GIF 100 images, all 200x200 pixels in dimension, that have only two values, 0 and 255. I'd like to create a single image that shows an accumulation of all pixel location where that particular value (255) appeared in all images. Something like below.

n	n+1	composite
000	010	010
100	001 ..etc. --->	101
101	111	111

I'm running IDL 4.0.1

Thanks for any suggestions,
Scott Gennari
