Subject: making a composite from several images

Hi all,

Could someone outline a simple way to create a composite image from
serveral images. I have about GIF 100 images, all 200x200 pixels in dimension,
that have only two values, 0 and 255. I'd like to create a single image that
shows an accumulation of all pixel location where that particular value (255)
appeared in all images. Something like below.

```
n    n+1            composite

000  010            010
100  001  ..etc. --->  101
101  111            111
```

I'm running IDL 4.0.1

Thanks for any suggestions,
Scott Gennari
