Subject: PS color image, poor quality

Posted by Luca Bertello UCLA As on Tue, 18 Jun 1996 07:00:00 GMT

Hi,

this is probably a stupid question...I'm trying to print out
some color images using a HP DeskJet 1200C/ps printer. I know
this printer is not a "state of the art" but the different quality
between output on the screen and on the paper seems to me too much
(even using very good quality papers). I even know that there is a
difference
between the color system used by IDL (RGB or truecolor) and the
one used by the printer. So far to produce my ps file
I just give the following comands:

```
set_plot,'ps'
 !p.font = 0    ;this for something else...
device,/color,bits=8
 tvscl,image,....
 device,/close
```

Is there a more smart way to produce a better quality output
whitout buying a more expensive color printer ?

thanks in advance, Luca
