Is it possible to plot several times in one plot, using polyfill?

I have three panels, all with time on the x-axis.

Because of the dimensions of the array, I want to divide the time in five, and plot with polyfill in all three panels, then repeat this five times.

But when I do this, polyfill just refer to last plot-command, and panel three becomes very colourful.

How can I make polyfill return to upper panel after first loop?

Please help!
