Hello,

I have an array of floating numbers. Can I add one line as the first line of the array, and one column as the first column, The data I would like to add is strings. Basically, I want to print them into a txt file

E.G.:

data= fltarr(9,9) years = ['1950', '1960', '1970', '1980', '1990', '2000', '2010', '2020', '2030'] Name= ['test1', 'test2', 'test3', 'test4', 'test5', 'test6', 'test7', 'test8', 'test9']

I want to print years as a 1st line of the txt file, and Name as the 1st column, then the data array.

Thanks
