Hi.

I have an strange problem today, I use IDL.7 under linux(ubuntu) .
I try to change the background color. with below command I create the window.

```
window,xsize=1400,ysize=1400
```

```
TVLCT,150,50,120,0
```

```
plot,x,y,/psym,yrange=[5.6,5.75],xrange=[9.5,11.8],charsize= 3 ,title='  
none ',background=180 /NoData
```

I use both commands(TVLCT and background) and change the numbers ,but
still the window is in black !
but when I write the TVLCT command in the terminal and run the file ,
the color changes!!!!!!
how can I control the background color from inside of pro not
terminal ?!!
best,nakisa
